

AMENDMENTS TO THE SPECIFICATION

Please amend the Specification as follows:

On page 12, amend ¶ [0043] as follows:

[0043] Fig. 3 is a flow diagram of a process performed by a mobile station to determine whether a reverse request message is to be sent to a base station. The mobile station iteratively performs (at 202) the process for all active service instances i , where $i = 0 - N$ ($[N - 1]$ N being a value from 0 to some predetermined maximum number of service instances that can be active in a call). The mobile station detects (at 204) if a trigger condition is satisfied for the service instance i .
